<p>Description</p> <p>Different repository for version.</p> <p>We often fork repositories to apply special fixes and build a different version until upstream merges, this fails if the default repository misses the specified branch.</p> <p>example rosjava_bootstrap:</p> <pre>"versions": [{ "name": "clf", "variables": { "repository": "https://github.com/CentralLabFacilities/rosjava_bootstrap.git", "branch": "clf" } }], "variables": { "description": "bootstrap rosjava", "repository": "https://github.com/rosjava/rosjava_bootstrap.git", "branches": ["kinetic"], }</pre> <p>as the fix branch is not in upstream</p>
