Target version:			
Description			
<p>Introduce a test script, that sweeps compile parameters (e.g. AMIROOS_CFG_DBG), compiles all modules with these settings and evaluates compilation results (success, failure, warning) to match the expected output. Since such a thorough compilation test will probably take quite some time, this should not be executed automatically by some CI tool but only on demand.</p> <p>Preferably, this script will be included in the ./setup.sh bash script environment.</p>
